

# On-street parking sensors

## On-street parking sensors

*Over 3,600 parking sensors are deployed throughout the streets belonging to the zone parking system providing accurate information on available parking spaces.*

The parking sensor is located on the parking space detecting car presence or absence and sending information whether the space is available or occupied on the Info-boards installed at crossroads.

The new Parking System that guides drivers to available parking spaces was first integrated in 2016 in the area around Njegoševa Street, in Belgrade. Since then the System has expanded to the other parts of the city including streets bordered with Beogradska, Krunska, Baba Višnjina and Bulevar kralja Aleksandra, as well as in the area of Clinical Center and Bulevar oslobođenja.

In order to provide valid data for a parking sensor system, drivers must properly park their vehicles at a precisely marked parking space, above the sensor itself.
